WEEKLY HEALTH REPORT

NATURE OF THE DATA

The data presented here are taken from the Statistical Health Reports, Form 86ab, rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States.

Because of the desirability of placing the information in circulation at the earliest possible time following its receipt, figures are in general shown herein as reported. Where there is some doubt as to the accuracy of the reported figures, their verification is requested, and the fact that they have been so questioned is indicated by the symbol (?).

MORBIDITY DATA

Admissions are reported only for cases hospitalized or confined to quarters and excused from duty for 24 hours or more, except for certain cases carded for record only (chiefly venereal disease cases which are treated on a duty status, and deaths which occurred before being "admitted" to hospital or quarters). Admissions designated as "injury" comprise all traumatisms (i.e., morbid conditions due to external causes, including poisons taken internally, results of exposure to heat, cold and light, and reactions to medications). Bearing in mind that under present conditions there would not be any direct admissions in the continental United States properly classifiable as battle casualties, all other cases are classified as "disease."

Admissions rates are shown for all causes combined, for all diseases combined, for injuries and for a few specific diseases. These rates are presented on an annual basis to facilitate comparisons with corresponding rates in annual and monthly reports. Such annual rates of admission indicate the number of admissions per thousand mean strength which would occur over a year's time if the current week's experience continued for a year.

The report also shows the number of cases of the more common communicable and certain other diseases of special interest. Appended is a list of cases reported for the rarer communicable and certain other diseases.

The number of patients remaining in hospital at the end of the week per thousand strength as given in this report furnishes an approximation to the current non-effective rate. The mean number of non-effectives per thousand strength is given in the summary table for the total United States and for each of the Service Commands.

MORTALITY DATA

Recent studies indicate that the reporting of deaths on Forms 86ab is incomplete, especially in the case of deaths from injury. The resulting understatement in the mortality rate from injury may be as much as 25 percent and occasionally even more, but the death rate from disease is not materially understated. Therefore in computing mortality rates from injury and from all causes on the basis of the corresponding numbers of deaths, as shown in this report, an appropriate adjustment for the underreporting of such deaths must be made.

STATIONS WITH HIGHEST MORBIDITY RATES

Included in the report is a table listing the stations (having strength of 5000 or over) with the highest morbidity rates from all causes, from all

diseases combined, from injuries, and from a few specific diseases. Not infrequently, the excessively high rates of admission for all causes and for all diseases combined reported from reception centers reflect a large number of venereal disease cases among newly inducted men. Therefore, more significant of high morbidity from disease are the rates of admission for disease excluding venereal infections existing prior to induction, which rates are also shown in the table.

HOSPITALIZATION DATA

Current hospitalization conditions are presented in terms of bed capacity (normal and total), total beds occupied and beds "available vacant."

Unless otherwise specified, normal bed capacity in this report is defined in Par. 36b (1) and (2) of AR40-1080, 10 December 1943, and Par. 14 WD Circular 43, 1 February 1944. This includes the T/O capacity of non-fixed hospitals but excludes convalescent facilities. Total beds include expansion beds in addition to normal beds. Beds in dispensaries, convalescent facilities, venereal disease facilities, and college or university training units are not included in the tabulations for individual stations.

The number of beds "available vacant" is defined as 80% of the total capacity less the corresponding beds occupied. The number of beds "available vacant" for each Service Command is the total beds "available vacant" for only those stations in which 80% of the total bed capacity exceeds the beds occupied.

In the case of general hospitals there are shown, in addition, the number of Army patients admitted and disposed of during the week (by death, return to duty, transfer, or otherwise), the number of such patients remaining in hospital (including convalescent facilities, if any) at the end of the week, and corresponding data for battle casualties. The bed capacity and beds occupied in convalescent facilities are also indicated. The patients "otherwise" disposed of represent for the most part discharges on account of disability. In the case of Army battle casualties, all of which are currently admitted to general hospitals in this country as transfers, there is shown for each hospital the net number transferred during the week; i.e., admissions by transfer less dispositions by transfer. The total for the country as a whole represents the number of battle casualties evacuated to the United States from overseas theaters.

EXPLANATORY MATTER

In reading the detail tables, it should be borne in mind that admission rates based on small numbers of cases are not reliable. For this reason the symbol (?) is placed after admission rates computed on the basis of 5 or fewer cases.

Where the current week's data for a particular station has not been received, the latest available figures are substituted therefor and the symbol (#) is placed after the name of the station.

Because troops in transit and certain small detachments are not required to submit Reports, as well as for other reasons, the total strength of the reporting units as shown on this report has been consistently about four percent under the actual strength of the Army in the Continental United States.

WEEKLY HEALTH REPORT

FOR THE WEEK ENDING 2 JUNE 1944

COMMENT ON CURRENT TRENDS

CURRENT MORBIDITY IN THE CONTINENTAL UNITED STATES

All Causes: Disease and Injury:

As indicated in the chart on page 3, the admission rates from all causes and from all diseases combined decreased notably for the week ending 2 June 1944. For this week the admission rate from all causes was reported at 557 per year per thousand and the admission rate from disease at 485 per thousand. This represented a decline of about 7 percent from the rate registered the previous week. As a result the current week's admission rates are by far the lowest recorded not only during the current year but also during 1942 and 1943. As compared with the corresponding week of 1943, current morbidity is about 20 percent lower.

Morbidity from injury was reported at 72 per thousand or somewhat above the very low level which has prevailed during 1944 to date.

Respiratory Causes:

The admission rate from colds, influenza, etc. decreased for the fifteenth consecutive week, being currently reported at 84 per thousand or 19 percent below the rate for the preceding week and 50 percent under the rate for the corresponding week of 1943. The current week's admission rate from these causes is not only the lowest reported in 1944 to date but also below the lowest rates registered during 1942 and 1943.

The admission rate from pneumonia declined to 9 per thousand, the lowest rate recorded so far this year and about 35 percent below the rate for the corresponding week of 1943.

Common Communicable Diseases:

Morbidity from venereal disease (excluding cases contracted prior to entry into active service) decreased from the high rate of 33 per thousand reported in the preceding two weeks to 29 per thousand for the current week. The number of new cases of measles, mumps, and scarlet fever all declined appreciably, the relative decreases from the previous week being about 20 percent for measles, 15 percent for mumps, and 25 percent for scarlet fever. The number of new cases of measles and scarlet fever were by far the lowest reported for any week this year. The number of new cases of meningitis and rheumatic fever remained at about the same level as during the previous week.

VARIATIONS IN MORBIDITY BY SERVICE COMMAND

All Causes: Disease and Injury:

All Service Commands except the First showed decreases in morbidity from all causes and from disease. The greatest decline was reported by the Third Service Command in which morbidity returned to the level prevailing there some weeks ago before the occurrence of two outbreaks of food poisoning. There is relatively little variation in morbidity as between Service Commands, in contrast to the situation early in the year. Thus

NON-EFFECTIVE RATE

CONTINENTAL UNITED STATES

PATIENTS REMAINING UNDER TREATMENT

CONTINENTAL UNITED STATES

WEEKLY HEALTH REPORT

FOR THE WEEK ENDING 2 JUNE 1944

COMMENT ON CURRENT TRENDS (CONT'D)

exclusive of the Military District of Washington, which had an admission rate from all causes of 663 per thousand, the highest admission rate from all causes was 611 per thousand in the Second Service Command and the lowest rate was 530 per thousand in the Eighth Service Command, a range of variation of only about 15 percent of the average rate for the country as a whole.

Respiratory Causes:

All Service Commands reported lower morbidity from colds, influenza, etc. Decreases of 20 percent or more were registered in the Second, Fifth, Sixth, and Seventh Service Commands. For the first time in many weeks the Seventh Service Command did not experience the highest morbidity from this cause, being supplanted by the Military District of Washington which, however, reported the relatively low rate of 109 per thousand. The lowest rate (65 per thousand) was again experienced in the Fourth Service Command.

Morbidity from pneumonia declined in the three Service Commands which had the highest rates the previous week. Nevertheless, the Sixth Service Command continued to report the highest morbidity from this cause (17 per thousand), but at a rate only about half of that which prevailed in this Service Command during the early part of the year.

Common Communicable Diseases:

Morbidity from venereal diseases (excluding EPTS cases) was considerably lower in the Fifth, Sixth, Seventh, and Eighth Service Commands and about the same in the other Commands. Nonetheless, the Fifth Service Command continued to report the highest morbidity from this cause (44 per thousand). New cases of measles declined sharply in the Sixth and Seventh Service Commands. A large proportion of the decrease in the number of new cases of mumps was accounted for by markedly fewer cases in the Fourth Service Command. The decline in the number of new cases of scarlet fever was almost entirely accounted for by the Seventh and Eighth Service Commands.

NON-EFFECTIVE RATE:

The non-effective rate decreased slightly to a figure of 36.1 per thousand for the current week. It should be emphasized that despite lower morbidity experience the current level of the non-effective rate is higher than during the corresponding period of 1943 almost entirely because of the steadily increasing number of evacuees from overseas theaters. Because of the non-uniformity in the distribution of General Hospitals as between Service Commands, variations in the non-effective rates by Service Command have little significance.

†ALSO INCLUDES BEDS IN NON-FIXED HOSPITALS AT MANEUVER AREAS.

WEEKLY HEALTH REPORT

FOR THE WEEK ENDING 2 JUNE 1944

COMMENT ON CURRENT TRENDS (CONT'D)

PATIENTS REMAINING UNDER TREATMENT:

The total number of Army patients remaining in hospital at the end of the week decreased to 35 per thousand strength. The number of neuropsychiatric cases remaining as of 2 June 1944 was reported at 15,940 or slightly below the number for the previous week. The number of malaria cases under treatment has increased steadily in recent weeks from a low of 1,748 on 14 April to 2,154 on 2 June 1944; only 41 of these cases presumably were acquired in the United States. The number of tuberculosis cases remaining under treatment was reported at 1,145 as of 2 June 1944.

The net number of battle casualty patients admitted during the week was only 5 in contrast with almost 800 in the previous week. The five receiving and evacuation hospitals reported only 18 admissions by transfer (and 419 dispositions by transfer).

CURRENT HOSPITAL CONDITIONS:

The total bed capacity as of 2 June 1944 was reported at about 368,000 or about the same as at the end of the previous week. The number of beds occupied was 140,000 or 3,000 less than for the previous week, while the number of "available vacant" beds increased to 154,500. Total beds occupied represented 38 percent of total bed capacity. There were 12 stations with bed capacity of about 9,000 having no "available vacant" beds; two General Hospitals with a bed capacity of about 5,000 were included among them.

The number of normal beds remained at about 280,000 or 76 percent of the total bed capacity. Included in the normal bed capacity were 660 T/O hospital beds and tentage, while the total bed capacity included 740 such beds, of which 140 were occupied.

The total bed capacity of General Hospitals was again reported at about 109,000 (the highest figure so far attained); about 47,000 of these beds (or 43 percent) were occupied. The "available vacant" beds at General Hospitals numbered 40,000. Normal beds at General Hospitals have been maintained at a level of about 85,000 since the beginning of the year.

The total bed capacity of Station Hospitals (including the relatively small number of T/O hospital beds and tentage mentioned above) continued at the 259,000 beds reported since 5 May 1944. Normal beds in these hospitals remained at about 195,000. Total beds occupied as of 2 June 1944 numbered 93,000 (or 36 percent of the corresponding total bed capacity) which is the lowest level reported during 1943 and 1944 to date. Station Hospitals had 111,000 "available vacant" beds as of 2 June 1944.

As of 2 June 1944 the bed capacity of convalescent facilities in General Hospitals numbered 14,326 beds of which 1,498 beds (or 31 percent) were occupied.

SUPPLEMENTARY HEALTH REPORT

FOR THE FOUR WEEK PERIOD ENDING 26 MAY 1944
PRISONERS OF WAR

During the four week period ending 26 May 1944, morbidity from all causes among prisoners of war was at a rate of about 580 admissions per year per thousand strength. This rate is about 5 percent under that for U. S. troops in the continental United States during the same period. Morbidity from all diseases combined during May for prisoners of war was 465 per thousand strength, while the admission rate for injury was about 115 per thousand or almost double the corresponding rate for U. S. troops in this country.

The May admission rates from all causes and from all diseases combined among prisoners of war were about 10 percent higher than those recorded in April. Since January, when morbidity among prisoners of war was exceptionally low (30 percent under that for U. S. troops in this country), the admission rates for prisoners of war have increased steadily up to the present point at which they are close to those for U. S. troops in this country. The May admission rate for injury was about 20 percent higher than the rate for April and about 40 percent higher than that for the first three months of the year.

For the first time this year the disease admission rate among Italian prisoners of war was higher than among German prisoners although morbidity from injuries for Germans continued to be almost three times as high as for Italians. In contrast with the previous month, morbidity from disease remained about the same for Germans but increased by about 25 percent for the Italians.

Recently many Italian prisoners of war have been transferred to the so-called Italian Service Units.

Since the regulations did not provide for the reporting of such a classification, only about two-thirds of the personnel of Italian Service Units are included in the data covered by this report.

Despite the fact that morbidity from all diseases combined has increased steadily during the past few months, the trend from colds, influenza, etc. among prisoners of war has been downward. The admission rate of 57 per thousand during May represented a decline for the fifth successive month and is appreciably lower than the minimal seasonal rates experienced by U.S. troops in the summer months. Current morbidity from colds, influenza, etc. among U. S. troops is about double the level for prisoners of war. As in previous months morbidity from this cause was higher for Italians than for Germans, the respective admission rates being 83 and 49 per thousand.

Morbidity from all forms of pneumonia (principally atypical) continued at the very low level of about 2 per thousand strength or less than 20 percent of the corresponding rate for U. S. troops in this country.

The current month's morbidity from malaria (representing almost entirely cases presumably acquired outside the United States) decreased slightly from the record high of 94 per thousand in April to 89 per thousand in May. The number of cases of malaria reported as having been presumably acquired in the United States was 17 or about the same as in the previous month. The new cases of the other communicable diseases considered in the following tables were relatively low, both as to number and rate of admission.

SUPPLEMENTARY HEALTH REPORT

FOR THE FOUR WEEK PERIOD ENDING 26 MAY 1944

PRISONERS OF WAR (CONT'D)

The camps reporting the highest morbidity from disease were Camp Ashby, Va. (G), Camp White, Oreg. (G) and New Orleans POE, La. (I) all of which had rates of more than 1600 per thousand. Certain camps continued to have high admission rates from injury, namely; Clinton, Miss. (G) and Camp Gruber, Okla. (G) both of which have had rates of 300 per thousand or more for each of the five months of 1944. In addition high rates of admission from injury were also reported by the following: Camp Ashby, Va. (G), Camp Davis, N. C. (G), Camp Gordon-Johnston, Fla. (G) and Camp Claiborne, La. (G) all of which had rates of over 600 per thousand in May.

The number of prisoners of war remaining under treatment in hospital at prisoner of war camps as of 26 May 1944 and the corresponding rates per thousand strength are shown below. The total number of prisoner patients at the end of the current month was about 5 percent lower than as of the end of April, although the number of Italians showed an increase (reflecting their higher admission rate previously mentioned). In addition to the prisoners remaining under treatment in hospital at the prisoner of war camps as shown below, there were 902 remaining under treatment in other hospitals; of these 765 were in General Hospitals.

SUPPLEMENTARY HEALTH REPORT ON WAC

FOR FOUR WEEK PERIOD ENDING 26 MAY 1944

During the four week period ending 26 May 1944, the annual rate of admission from all causes combined among WAC personnel at 32 selected stations was about 1100 per year per thousand strength. This rate is about 10 percent lower than the rate reported for the previous month, entirely due to a corresponding decline in the admission rate from respiratory causes. The morbidity of the WAC during May was almost twice as high as that for the total Army in the continental United States (about 600 per thousand).

The injury admission rate for the WAC was 83 per thousand for May, or also about 10 percent lower than for the previous month. It should be noted however that the injury rate for the WAC during May was about 30 percent higher than the rate for the total Army (about 65 per thousand).

Morbidity from all causes varied considerably by station. The admission rate at many stations was around 500 to 700 per thousand, but there were quite a number with rates ranging from 900 to 1200 per year. The highest rates were registered at Drew Field (4391 per thousand), Ft. Jackson (2403 per thousand), and Ft. Bragg (1908 per thousand).

The two largest stations, Ft. Oglethorpe and Ft. Des Moines (which account for about 45 percent of the total strength of the 32 stations under consideration) experienced above-average morbidity. If these two large stations, which are predominantly training centers, were eliminated from the experience, the admis-

sion rate from all causes for the remainder of the stations would be lowered to 881 per thousand or only about 45 percent higher than the rate for the total Army.

Morbidity from colds, influenza, etc. among the WAC was at the relatively high rate of 219 per thousand or almost double the rate for the total Army in the continental United States. Morbidity from other communicable diseases shown in the following tables was at a relatively low level. Neuropsychiatric disorders accounted for an annual admission rate of 46 per thousand or considerably above the corresponding figure for the total Army.

As of 26 May 1944 there were 552 WAC's remaining as patients in hospital or quarters at these stations, a decline of about 10 percent as compared with the end of the previous month. The number of WAC patients in hospital at the end of the period represented a rate of about 20 per thousand strength or somewhat lower than the corresponding figure of 22 per thousand for the total Army in the United States exclusive of patients in General Hospitals. This indicates that by and large the excess morbidity of the WAC as compared with male personnel is represented by relatively minor complaints which generally do not require hospitalization. In addition to the 498 WAC's remaining in hospital at these stations at the end of the month, there were 361 WAC's occupying beds in General Hospitals (exclusive of Walter Reed General Hospital which is one of the selected stations).
